Dr. Rogers

Our motivation for this app is to help students understand how Venn diagrams can be used to determine whether an argument is valid. While students can learn the rules from lectures or textbooks, they have very limited opportunities to actively practice constructing diagrams and immediately receive feedback on their reasoning. Our app would provide an interactive way for students to practice these skills in a low-pressure environment.

The app would allow students to work through arguments by directly interacting with Venn diagrams, making an abstract logic process more visual and hands-on. Students could use the tool to practice shading regions, placing X's, and determining whether an argument is valid or invalid. Immediate feedback would help students identify exactly where their reasoning went wrong instead of simply seeing whether their final answer was correct. The app would be useful for Thinking Critically students and instructors. Having the ability to work with interactive practice and accessibility makes their studying much easier.

Amount Correct: __

Amount Incorrect: __

Very General thought of what this could look like without having met with the client.

The bottom image would appear over the top image covering just the right side of the screen indicating amount right vs wrong. After a submit action.
